20. ABSTRACT (Continue on reverse side il necessary and identify by block number)

The Paper Goods Pond Dam is a concrete and masonry structure. It is approx. 70 ft. long, 30 ft. high and has an average top width of 4 ft. The Paper Goods Pond Dam is classified as SMALL in size and a HIGH hazard potential structure in accordance with the Recommended Guidelines for Safety Inspection of Dam. The test flood for this dam is ½ the Probable Maximum Flood (PMF). Based on visual inspection and past operational performance, the dam is judged to be in FAIR condition.

REPLY TO ATTENTION OF: NEDED-E

MAY 0 6 1981

Honorable William A. O'Neill Governor of the State of Connecticus State Capitol Hartford, Connecticut 06115

#### Dear Governor O'Neill:

Inclosed is a copy of the Paper Goods Pond Dam (CT-00253) Phase I Inspection Report, which was prepared under the National Program for Inspection of Non-Federal Dams. The report is based upon a visual inspection, a review of past performance, and a preliminary hydrological analysis. A brief assessment is included at the beginning of the report.

The preliminary hydrologic analysis has indicated that the spillway capacity for the Paper Goods Pond Dam would likely be exceeded by floods greater than 9 percent of the Probable Maximum Flood (PMF). Our screening criteria specifies that a dam of this class which does not have sufficient spillway capacity to discharge fifty percent of the PMF, should be adjudged as having a seriously inadequate spillway and the dam assessed as unsafe, non-emergency, until more detailed studies prove otherwise or corrective measures are completed.

The term "unsafe" applied to a dam because of an inadequate spillway does not indicate the same degree of emergency as that term would if applied because of structural deficiency. It does indicate, however, that a severe storm may cause overtopping and possible failure of the dam, with significant damage and potential loss of life downstream.

It is recommended that within twelve months from the date of this report the owner of the dam engage the services of a professional or consulting engineer to determine by more sophisticated methods and procedures the magnitude of the spillway deficiency. Based on this determination, appropriate remedial mitigating measures should be designed and completed within 24 months of this date of notification. In the interim a detailed emergency operation plan and warning system should be promptly developed. During periods of unusually heavy precipitation, round-the-clock surveillance should be provided.

HE State William A. O'Neill

Bave approved the report and support the findings and recommendations described in Section 7, with qualifications as noted above. I adjust that you keep me informed of the actions taken to implement these recommendations since this follow-up is an important part of the num-Federal Dam Inspection Program.

A copy of this report has been forwarded to the Department of Environmental Protection, the cooperating agency for the State of Connecticut. This report has also been furnished to the owner of the project, Sherwood-Industries, Inc., 10 Main Street, Kensington, Connecticut 06037.

Copies of this report will be made available to the public, upon request to this office, under the Freedom of Information Act, thirty days from the date of this letter.

I wish to take this opportunity to thank you and the Department of Environmental Protection for the cooperation extended in carrying out this program.

C.E. EDGAR, III

Colonel, Corps of Engineers

Division Engineer

# PAPER GOODS POND DAM CT 00253

PHASE 1 INSPECTION REPORT

NATIONAL DAM INSPECTION PROGRAM

#### BAL DAM INSPECTION PROGRAM

#### **SHASE I - INSPECTION REPORT**

Identification (a) : CT 00253

Name of Dam: Paper Goods Pond Dam

Yown: Berlin

County and State: Hartford, Connecticut

Stream: Mattabesset River

Date of Inspection: November 12, 1980

#### **BRIEF ASSESSMENT**

The Paper Goods Pond Dam is a concrete and masonry structure. It is approximately 70 feet long, 30 feet high and has an average top width of 4 feet. The Paper Goods Pond Dam was probably constructed in 1920 with subsequent improvements in 1939.

The present owner and operator of the dam is Sherwood Industries, Inc., which uses the pond for industrial water supply.

Based on visual inspection and past operational performance, the dam is judged to be in FAIR condition. Seepage was noted through the southwest abutment and along the southern downstream channel wall. The 10 inch supply main presently has no control at the dam.

The dam is classified as SMALL in size and a HIGH hazard potential structure in accordance with the Recommended Guidelines for Safety Inspection of Dams, established by the Corps of Engineers. The impoundment storage at the top of the dam is 150 ac.-ft. and the maximum height of the dam is 30 feet. Failure of the dam would result in the loss of more than a few lives and damage to numerous homes and buildings. The depth of inundation at these homes and buildings would be 0 feet before and 1 to 3 feet after dam failure.

The test flood for this dam is 1/2 the Probable Maximum Flood (PMF). The test flood has an inflow equal to 6415 cfs and an outflow discharge equal to 6400 cfs with a stillwater elevation of 125.0 which will overtop the dam by 5.5 feet.

The maximum outflow capacity of the spillway with the water surface at the top of the dam is 1190 cfs, which is 19 percent of the test flood outflow.

It is recommended that the following items be studied further by a qualified registered engineer: The condition of the upstream face, the inability of the spillway to pass the test flood without overtopping the dam, seepage at the southwest abutment and southern downstream wall, and the lack of upstream control for the 10 inch supply main.

The following remedial measures should be taken by the owner: Clearing the downstream channel, repair washouts of stone walls along downstream channel, supplementing the existing emergency plan with a downstream warning plan and an annual technical inspection program.

Recommendations and remedial measures that should be implemented within one year of receipt of this Phase I Inspection Report are further described in Section 7.

#### **PREFACE**

This report is prepared under guidance contained in the Recommended Guidelines for Safety Inspection of Dams, for Phase I Investigations. Copies of these guidelines may be obtained from the Office of Chief of Engineers, Washington, D.C. 20314. The purpose of a Phase I Investigation is to identify expeditiously those dams which may pose hazards to human life or property. The assessment of the general condition of the dam is based upon available data and visual inspections. Detailed investigation, and analyses involving topographic mapping, subsurface investigations, testing, and detailed computational evaluations are beyond the scope of a Phase I Investigation. However, the investigation is intended to identify any need for such studies.

In reviewing this report, it should be realized that the reported condition of the dam is based on observations of field conditions at the time of inspection along with data available to the inspection team. In cases where the reservoir was lowered or drained prior to inspection, such action, while improving the stability and safety of the dam, removes the normal load on the structure and may obscure certain conditions which might otherwise be detectable if inspected under the normal operating environment of the structure.

It is important to note that the condition of a dam depends on numerous and constantly changing internal and external conditions, and is evolutionary in nature. It would be incorrect to assume that the present condition of the dam will continue to represent the condition of the dam at some point in the future. Only through continued care and inspection can there by any chance that unsafe conditions be detected.

Phase I inspections are not intended to provide detailed hydrologic and hydraulic analyses. In accordance with the established Guidelines, the spillway test flood is based on the estimated "Probable Maximum Flood" for the region (greatest reasonably possible storm runoff), or fractions thereof. Because of the magnitude and rarity of such a storm event, a finding that a spillway will not pass the test flood should not be interpreted as necessarily posing a highly inadequate condition. The test flood provides a measure of relative need for more detailed hydrologic and hydraulic studies, considering the size of the dam, its general condition and downstream damage potential.

The Phase I Investigation does not include an assessment of the need for fences, gates, no-trespassing signs, repairs to existing fences and railings and other items which may be needed to minimize trespass and provide greater security for the facility and safety to the public. An evaluation of the project for compliance with OSHA rules and regulations is also excluded.

PHOT AKEN DECEMBER 15, 1980

NATIONAL DA.

**UGRAM** 

PHASE I - MISE ON REPORT

NAME OF DAM: PAPER GOODS POND DAM

#### SECTION 1

#### **PROJECT INFORMATION**

#### 1.1 General:

#### a. Authority:

Public Law 92-367, August 8, 1972, authorized the Secretary of the Army through the Corps of Engineers, to initiate a national program of dam inspection throughout the United States. The New England Division of the Corps of Engineers has been assigned the responsibility of supervising the inspection of dams within the New England Region. James P. Purcell Associates, Inc. has been retained by the New England Division to inspect and report on selected dams in the State of Connecticut. Authorization and notice to proceed was issued to James P. Purcell Associates, Inc., under a letter from William E. Hodgson, Jr., Colonel, Corps of Engineers. Contract No. DACW33-81-C-0009 has been assigned by the Corps of Engineers for this work.

#### b. Purpose:

- Perform technical inspection and evaluation of non-Federal dams to identify conditions which threaten the public safety and thus permit correction in a timely manner by non-Federal interests.
- Encourage and prepare the States to initiate quickly, effective dam safety programs for non-Federal dams.
- 3. To update, verify and complete the National Inventory of Dams.

#### 1.2 Description of the Project:

#### a. Location:

The Paper Goods Pond Dam is located in the Town of Berlin, one half mile southwest of the Village of Kensington, at the intersection of Percival Avenue and Main Street, both Connecticut Route No. 71 (See Plate No. 1). The dam impounds water from the Mattabesset River and is located approximately 11.5 miles above the confluence with the Connecticut River. The pond is situated in a northeast/southwest direction, with the dam at the northeast end. The latitude is 41°37′-49.2″ and the longitude is 72°46′-47.8″. All elevations used in this report are based on the National Geodetic Vertical Datum (NGVD).

#### b. Description of Dam and Appurtenances:

The Paper Goods Pond Dam is a stone masonry arch structure approximately 70 feet long, 30 feet high, with a top width of 4 feet. The downstream face is vertical and coated with gunite. In plan, the face is arched with a radius of approximately 50 feet.

The spillway is 58 feet long and extends the full length of the dam except for a 32 inch high step at the northeast end for the outlet work controls. The spillway crest is 4 feet wide and consists of large cut stones.

The outlet works consist of a 16 inch blow-off through the central portion of the dam and a 48 inch penstock at the northeastern end of the dam. Both outlets are regulated at the dam by hand operated controls on a platform at the northeast end of the dam.

A 10 inch supply main extends from the dam to a sealed terminus at the boiler house downstream of the dam. This pipe has no control at the dam and is under pressure until the terminus.

The bridge for Percival Avenue (Route 71) is located 25 feet upstream of the dam.

#### c. Size Classification:

The size classification of this dam is SMALL as per the criteria set forth in the Recommended Guidelines for Safety Inspection of Dams by the Corps of Engineers. The impoundment storage at the top of the dam is 150 ac.-ft. (within the range of 50 to 1000 ac.-ft.) and the maximum height of the dam is 30 feet (within the range of 25 to 40 feet). The size classification is based on both the height and storage criteria.

#### d. Hazard Classification:

The hazard classification of this dam is HIGH as per the criteria set forth in the Recommended Guidelines for Sefety Inspection of Dams, by the Corps of Engineers. The dam is located upstream of numerous homes and buildings where failure discharge may cause the loss of more than a few lives and cause damage due to high velocity impact from debris and flooding. The estimated water depth due to the assumed dam failure may range from 30 feet at the dam to 0.6 feet, 6000 feet downstream at a large swampy area. The depth of inundation at the homes and buildings would be 0 feet before and 1 to 3 feet after tam failure.

#### e. Ownership:

The Paper Goods Pond Dam is presently owned and maintained by Sherwood Industries, Inc., 10 Main Street, Kensington, CT 06037.

#### f. Operator:

The person in charge of the operation of the dam is:

Mr. Sterling Gillette Sherwood Industries, Inc. 10 Main Street Kensington, CT 06037 Telephone: (203) 828-4161

#### g. Purpose:

The pond is presently used for industrial water supply by the owner of the dam. Water is withdrawn via an 8 inch pipe upstream of the dam. This pipe was not inspected. No water is withdrawn via the outlet works at the dam.

#### h. Design and Construction History:

The Paper Goods Pond Dam was probably constructed in 1920. The original dam was stone masonry with only the 48 inch penstock. In 1939, the entire dam was coated with reinforced gunite to limit leakage and the 16 inch blow-off and 10 inch supply pipe were installed.

#### i. Normal Operating Procedures:

All water is discharged over the spillway except that withdrawn via the upstream 8 inch pipe.

#### 1.3 Pertinent Data:

#### a. Drainage Area:

The Paper Goods Pond Dam drainage basin is generally rectangular in shape with a length of 6.5 miles and an average width of 1.5 miles resulting in a total drainage area of 9.5 square miles (see drainage basin map in Appendix D). The topography is generally moderate to steep terrain, with elevations ranging from a high of 1044 feet to a low of 115.7 feet at the spillway crest. Stream and basin slopes are flat to steep, 0.1 to 10 percent and 2 to 50 percent respectively. The reservoir has a normal surface area of 12 acres which is 0.2 percent of the watershed.

#### b. Discharge at Dam Site:

There are no specific discharge records available for this dam. Listed below are calculated discharge values of the spillway and outlet works (16 inch blowoff pipe):

- 1. Outlet works: A 16 inch blow-off with an intake at approximately 100.7 and a discharge capacity of 30 cfs at elevation 119.5.
- 2. Maximum known flood at dam site: Unknown.
- 3. Ungated spillway capacity at top of dam: 1190 cfs at elevation 119.5.
- 4. Ungated Spillway capacity at test flood elevation: 4910 cfs at elevation 125.0
- 5. Gated spillway capacity at normal pool elevation: N/A
- 6. Gated spillway capacity at test flood elevation: N/A.
- 7. Total spillway capacity at test flood elevation: 4910 cfs at elevation 125.0.
- 8. Total project discharge at top of dam: 1220 cfs at elevation 119.5.
- 9. Total discharge at test flood level: 6400 cfs at elevation 125.0.

#### **SECTION 2**

#### **ENGINEERING DATA**

#### 2.1 Design:

There are limited available records presenting design information for the construction of the Paper Goods Pond Dam. A 1939 application to repair and modify the dam has been included in Appendix B of this report.

#### 2.2 Construction:

There are no available records of the construction of this dam.

#### 2.3 Operation:

No formal records of operation are kept for this facility.

#### 2.4 Evaluation

#### a. Availability:

The information noted above for this facility is available in the files of the Department of Environmental Protection, Water Resources Unit, Dam Safety Engineers, State Office Building, Hartford, Connecticut, and Sherwood Industries, Inc., Kensington, Connecticut

#### b. Adequacy:

The lack of indepth engineering data did not allow a definitive review. Therefore, the adequacy of this dam could not be assessed from the standpoint of reviewing design and construction data alone, but is based primarily on the visual inspection, the dam's past performance, and sound engineering judgment.

#### c. Validity:

The validity of the limited information available could not be verified.

Ĺ

#### **SECTION 3**

#### **VISUAL INSPECTION**

#### 3.1 Findings:

#### a. General:

The visual inspection of the Paper Goods Pond Dam was conducted on November 12, 1979 and a copy of the visual inspection check list is contained in Appendix A of this report.

The following procedure was used:

- Inspection of the upstream area of the reservoir which is impounded by the dam.
- 2. Visual inspection of the face and top of the dam and spillways for cracks, loose stones, seepage, etc.
- 3. Inspection of the outlet works and other appurtenances as to their existence, location and operability.
- 4. Review of procedures that could be utilized in the event of an emergency situation.
- A check of the downstream area for seepage, piping, boils or other indications of abnormal conditions. The downstream hazard potential in the event of dam failure was investigated.
- 6. Photographs of the general area of the dam and of specific items of note were taken and are included in Appendix C of this report.

Before the inspection, the available existing data was studied and reviewed.

#### b. Dam:

1. Crest: The top of the dam consists almost entirely of the spillway. At the southwest end, a 3.8 foot high concrete masonry wall extends 20 feet west from the spillway to natural ground (Photo C-4). At the northeast end, there is a 2.67 foot high step for the outlet works controls (Photo C-3). A 3.0 foot high wall extends 32 feet north to the Route 71 bridge wingwall. The top of the dam is 4 feet wide. The dam ties into rock on the southwest side and probably also on the northeast side.

- 2. Upstream Face: Water was flowing over the spillway on the day of the inspection and the upstream face was not visible. It reportedly was coated with reinforced gunite in 1939.
- 3. Downstream Face: The downstream face is stone masonry coated with reinforced gunite (Photo C-1). Much of the gunite is cracked and spalled (Photo C-6), and there is approximately 1/2 square foot of visible wire mesh reinforcing at the toe in the center of the spillway section. Seepage (2 gpm-clear) is occurring where the southwest abutment ties into the downstream face (Photo C-7). This has apparently existed for several years as indicated by correspondence in the Connecticut Department of Environmental Protection files.

#### c. Appurtenant Structures:

- Spillway: The 58 foot long spillway comprises almost the entire top of the dam (Photo C-2) and is constructed with a 4 foot wide stone or concrete cap. At the southeast end, there is a concrete pad at the spillway level approximately 15 feet by 15 feet. The purpose of this pad is unknown, and its condition appears good.
- 16 Inch Blowoff: A 16 inch pipe extends through the dam (Photo C-6) and is controlled by the slanted valve stem (Photo C-5). A wrench is used to operate the valve which was last opened in October, 1980.
- 3. 48 Inch Penstock: A 48 inch riveted steel penstock extends from the dam to an abandoned power house below the dam (Photo C-10). Flow into the penstock is controlled by the other two wheels on the top of the dam (Photo C-5). An attempt was made in 1974 to open the valve at which time several gear teeth broke. It is now believed to be inoperable. There is a vent for the pipe just below the dam, and the pipe is supported by concrete piers to the power house.
- 4. 10 Inch Supply Main: A 10 inch pipe extends through the dam to a sealed terminus at the boiler house. The pipe exits in the center of the northern half of the downstream face and extends along the dam under a spalled and chipped gunite shelf (Photo C-6 and Page B-10). At one time this pipe extended to a water tower (via pump) and was used to supply water for fire protection. When the company switched to municipal water, the pipe was cut and sealed in the boiler house. Reportedly, there is no control at the dam and the pipe is under pressure to the boiler house.

#### d. Reservoir Area:

The pond is formed by flooding a portion of the Mattabesset River valley. The sides of the valley have gentle slopes bordering the reservoir.

affect the dam or appurtenant structures.

Trespassing is not permitted on the dam and the site is fenced.

In 1974, a new bridge for Route 71 was constructed 25 feet upstream of the dam (Photo C-8). There are several large willow trees overhanging the pond upstream of the Route 71 bridge. The riprap placed around the abutments of the Route 71 bridge is eroding, primarily on the upstream side.

#### e. Downstream Channel:

The downstream channel from the dam to the power house is a rock gorge, with numerous trees and rock overhanging the channel (Photo C-1).

Seepage (the flow rate could not be determined due to the areal extent) is occurring out of the rock along the south channel wall for a distance of approximately 50 feet downstream of the dam (Photo C-7). This seepage may be occurring along the bedding and joint planes of the rock upon which the abutment is founded.

Below the power house, there are stone walls lining the channel which have washed out in many places. Numerous trees and brush overhang this channel (Photo C-9).

#### 3.2 Evaluation:

Based on the visual inspection, the Paper Goods Pond Dam appears to be in fair condition overall, and there were no major areas of distress noted. Specific areas of concern that were noted are:

- a. The condition of the stone walls and channel below the dam.
- b. The lack of control at the dam for the 10 inch supply main.
- c. The inoperability of the 48 inch penstock.
- d. The eroding of the riprap at the Route 71 bridge abutments.
- e. Seepage through the southwest abutment, possibly along bedding and joint planes of the bedrock. This has existed for several years, and although at present it does not appear to affect the adequacy of the dam, it should be corrected before further deterioration leads to a hazardous condition.

#### **SECTION 4**

#### **OPERATIONAL AND MAINTENANCE PROCEDURES**

#### 4.1 Operational Procedures:

#### a. General:

The Paper Goods Pond Dam is used for industrial water supply. This water is withdrawn upstream of the dam. All other water is normally discharged over the spillway, and all other outlet works are normally closed.

#### b. Description of Any Warning System in Effect:

According to Mr. Varano, representative of the owner, there are personnel at the building adjacent to the dam 24 hours per day. There is a list of people to contact in the event of emergencies.

#### 4.2 Maintenance Procedures:

#### a. General:

There is no regular maintenance schedule for the dam. Visual inspections of the dam and appurtenant structures are conducted twice a year. No records of these inspections are maintained.

#### b. Operating Facilities:

No regular maintenance of the outlet works was reported. The 16 inch blow-off is tested twice a year during the inspections and was last utilized in October, 1980.

#### 4.3 Evaluation:

To insure the safety of the residents downstream, a regular technical inspection and maintenance program and a formal downstream warning plan should be developed and implemented.

#### SECTION 5

#### **EVALUATION OF HYDRAULIC/HYDROLOGIC FEATURES**

#### 5.1 General:

The Paper Goods Pond Dam creates an impoundment with a total storage capacity of 77 ac.-ft. at elevation 115.67, the spillway crest elevation. Each foot of depth in the reservoir above the spillway crest can accommodate approximately 12 ac.-ft. The spillway is 58 feet long by 4 feet wide broad crested uncontrolled weir. Stream and basin slopes are flat to steep, 0.1 to 10 percent and 2 to 50 percent respectively.

#### 5.2 Design Data:

- a. No specific design data is available for this watershed or the structures of the Paper Goods Pond Dam. In lieu of existing design information, USGS topographic maps (scale 1"-2000") were utilized to develop hydrologic parameters such as drainage area, basin length, time of concentration, and other runoff characteristics. Elevation-storage relations for the reservoir were approximated. Reservoir surface area and surcharge storage were computed using the USGS maps. Some of the pertinent hydraulic design data was obtained and/or confirmed by actual field measurements at the time of the visual inspection.
- b. Outflow values (routing procedures) and dam overtopping analyses were computed in accordance with the guidelines developed by the Corps of Engineers. Judgment was used in calculating final values outlined in this report, which are quite approximate and should not be considered a substitute for actual detailed analysis.

#### 5.3 Experience Data:

Historical data for recorded discharges is not available for this dam.

#### 5.4 Test Flood Analysis:

Recommended guidelines for the Safety Inspection of Dams by the Corps of Engineers were used for the selection of the "Test Flood". This dam is classified as a HIGH hazard and SMALL size structure. Guidelines indicate that a range of 1/2 times the Probable Maximum Flood (PMF) to the PMF be used as the "Test Flood" for these classifications. A test flood of 1/2 PMF was chosen due to the small size of the dam. The watershed has a total area of 9.5 square miles. Snyder's lag was calculated to be 5.0 hours and a Snyder peaking coefficient of 0.625 was used. The 200 square mile-24 hour Probable Maximum Precpitation (PMP) is 21.5 inches. The flood hydrograph package, HEC-1 computer program developed by the Corps of Engineers was utilized to develop the inflow hydrograph, route the flood through the reservoir, and for the dam overtopping analysis. A test flood inflow equal to 1/2 PMF was calculated to be 6415 cfs (675 CSM).

The spillway capacity is hydraulically inadequate to pass the test flood (1/2 PMF) and overtopping of the dam will occur. The maximum outflow capacity of the spillway without overtopping the dam is 1190 cfs. This corresponds to approximately 19 percent of the test flood outflow and a storage above the primary spillway level of 73 ac-ft. The maximum outflow discharge value for the test flood is 6400 cfs corresponding to a depth of flow over the top of the dam of 5.5 feet and a storage above the spillway level of 249 ac.-ft. A spillway rating curve, an outlet rating curve, and a reservoir stage-capacity curve, are included in Appendix D of this report.

At the spillway elevation of 115.7, the capacity of the 16 inch outlet structure is 25 cfs. It will require approximately 21 hours to lower the water level the first foot assuming a water surface area of 12 acres, normal inflow conditions, and use of the outlet works to regulate the water level for expected inflows.

#### 5.5 Dam Failure Analysis:

This dam is classified as a high hazard structure. Failure discharge can cause the loss of more than a few lives and damage due to high velocities, impact from debris, and flooding to numerous homes and buildings along the downstream channel.

The calculated dam failure discharge is 6075 cfs due to an assumed breach width of 22 feet and a pre-failure pool level equal to the top of the dam. At this level the prefailure flow in the downstream channel will be equal to the full spillway's capacity of 1190 cfs corresponding to a depth of flow of 0.4 to 2.0 feet. Failure will produce a water surface level of approximately 5 feet immediately downstream from the dam. More than 20 homes and 8 buildings may be inundated by 0 feet before and 1 to 3 feet after dam failure. The failure discharge will affect downstream areas for a distance of 6000 feet from the dam. At this distance, the water surface level will be approximately 0.6 feet above normal observations as it enters a large swampy area. Beyond 6000 feet, the effects of the failure discharge will be reduced as it enters the large swampy area. Water surface elevations due to the failure of the dam are listed on Page D-17. Probable consequences including the prime impact areas are listed on Page D-23.

#### EVALUATION OF STRUCTURE

#### 6.1 Visual Observation:

The visual inspection revealed no signs of major physical distress in the structure. However, seepage is occurring through the southwest abutment and possibly along bedding and joint planes of the bedrock. This condition has apparently existed for several years and although at present it does not appear to affect the adequacy of the dam, it should be corrected before further deterioration leads to a hazardous condition.

V The Y

The upstream face of the dam and the southwest abutment could not be inspected due to the pond level. The seepage may be occurring or enhanced due to defects in the upstream face of the dam or southwest abutment.

Approximately 1/2 square foot of wire mesh reinforcing was visible at the downstream toe in the center of the dam. This apparently is reinforcing for the gunite coating. This exposed wire mesh does not appear to affect the integrity of the dam.

#### 6.2 Design and Construction Data:

There is insufficient design and construction data to permit a formal evaluation of stability.

#### 6.3 Post-Construction Changes:

The entire dam was coated with reinforced gunite in 1939.

The 10 inch supply main was also added in 1939. This pipe is presently sealed downstream at the boiler house. There is no control on the upstream face and the entire pipe is under pressure. The pipe should be sealed on the upstream face to prevent a hazardous situation should the pipe rupture.

#### 6.4 Seismic Stability:

The dam is in Seismic Zone 1 and hence does not require evaluation for seismic stability according to the Corps of Engineers Recommended Guidelines.

#### **SECTION 7**

#### **ASSESSMENT, RECOMMENDATIONS AND REMEDIAL MEASURES**

#### 7.1 Dam Assessment:

#### a. Condition:

Based on the visual inspection, past performance and hydraulic/hydrologic evaluation, the Paper Goods Pond Dam and appurtenances are judged to be generally in FAIR condition. Items of concern that should be addressed as a result of this inspection are listed in Sections 7.2 and 7.3.

#### b. Adequacy of Information:

The limited engineering data did not allow for a definitive review. Therefore the adequacy of the dam is based on visual inspection, past performance history, and engineering judgment.

#### c. Urgency:

The recommendations and remedial measures described below should be implemented by the owner within one year after receipt of this Phase 1 Inspection Report, except as noted.

#### 7.2 Recommendations:

It is recommended that the owner engage a qualified registered engineer to carry out the following actions and that his recommendations be implemented.

- A detailed hydrologic/hydraulic investigation to determine the need for and means of increasing the discharge capacity of the project.
- b. The upstream face be visually inspected.
- c. The seepage at the southwest abutment and southern downstream channel walt be investigated and monitored, and repairs designed as necessary. This work should be done immediately upon receipt of this report.
- d. The 10 inch supply main should be sealed on the upstream face of the dam

#### 7.3 Remedial Measures:

#### a. Operational and Maintenance Procedures:

The downstream channel should be cleared and the trees overhead.

- The stone walls below the power house should be repaired where they have washed out and the embankment filled and stabilized.
- 3. Supplement the existing emergency plan with a surveillance and downstream warning plan, including round-the-clock monitoring during heavy precipitation.
- 4. Institute a program of annual periodic technical inspection.

#### 7.4 Alternatives:

There are no practical alternatives to the above stated recommendations.

Superintendent of Dam Maintenance

Water and Related Resources

Re: Railroad Pond Dam Berlin, Connecticut

Dear Mr. Galgowski:

In accordance with your request, we have examined the subject dam in order to ascertain its structural soundness and stability. Prior to our visit to the site, we went to the Town Hall offices and attempted to obtain any structural drawings of the subject installation. We were advised that no plans were on file and that the Town officials had no knowledge whatsoever of the construction of the dam.

Upon visiting the site, we examined the structure which consists of a concrete dam approximately 70 feet long and 25 feet high. The shape of the dam and spillway together with the blow-off valve controls are as indicated on the enclosed sketch. While the dam itself appears to be structurally sound and stable, there are some maintenance steps that should be taken as soon as possible.

The spillway cap is badly deteriorated and washed out in the vicinity of the blow-off valves. The balance of the spillway cap is badly spalled, chipped, and cracked and should be repaired. The face of the dam itself should also be completely gone over and pointed up wherever cracks exist. There was no evidence of leaks on the face of the dam in spite of the various cracks and openings.

State c ...necticut Page 2

Re: Railroad Pond Dam

It is our considered opinion that if the above steps are taken to correct the minor deficiencies that the dam should remain serviceable for several years.

Should you have any questions concerning this report, feel free to contact me.

Respectfully submitted,

S. E. MINOR & CO., INC.

Edward F. Ahneman, Jr., P.E.

#### PAPER GOODS POND DAM

#### Dam Failure And This

1.	Failure discharge with pool at top of dam (elev. 119	.50) = 6075	CFS
2.	Depth of water in reservoir at time of failure =	30	ft.
3.	Maximum depth of flow downstream of dam =	30	ft.
4.	<pre>Water surface elevation just downstream) of dam at time of failure</pre>	119.50	

The failure discharge of 6075 CFS will enter and flow down-stream 6000 feet until the brook enters a large swampy area.

Valley storage in this 6000 feet length of brook is significant in reducing the discharge. Also due to roughness characteristics, obstructions and frictional losses, it is very likely that the unsteady dam failure flow will dissipate its wave and kinetic energy and thus convert to steady and uniform flow obeying Manning's formulae 6000 feet downstream. The failure profile will have the following hydraulic characteristics:

DISTANCE FROM THE DAM	WATER SURFACE ELEVATION	DEPTH (ft.)	REMARKS
0	119.5	30.0	At Dam
800	84.7	4.7	
2300	68.7	1.7	Pond
4200	51.4	1.4	
6000	40.6	0.6	Swampy Area
		j	
	}	1	
	1	]	1

NOTES: The impact area has been extended through the swampy area to Route 72, 11000 feet downstream.

## "Rule of Thumb" Guidance for Estimating Downstream Dam Failure Amalysis

#### DATA

Name of Dam PAPER GOODS POND DAM
Location BERLIN, CONNECTICUT
Drainage Area 9.5 sq. mi., Top of Dam 119.50
Spillway Type broad-overflow , Crest of Spillway 115.67
Surface Area @ Crest Elev. 12 Acres = 0.02 sq. mi.
Pool Bottom Near Dam = 89.5
Assumed Side Slopes of Embankments = 2:1
Depth of Pool at Dam (Yo) = 30 Feet
Mid-Height Elev. 104.5
Length of Dam at Crest = 70 Feet
Length of Dam at Mid-Height = 55 Feet
40 % of Dam Length at Mid-Height = W <sub>b</sub> = 22 Feet
Step 1
Storage (S) at time of failure 150 Ac-FT (Equal to top of dam)
Step 2
Peak Failure Discharge $Q_{pl} = 8/27 W_b \sqrt{g} Yo^{3/2}$
= $(1.68)$ ( $^{W}$ b) ( $^{Y}$ o) $^{3/2}$ 6075 cfs
Failure is assumed to coincide with pool elevation at top of dam.

REPLY TO ATTENTION OF: NEDED-E

MAY 06 1981

Honorable William A. O'Neill Governor of the State of Connecticut State Capitol Hartford, Connecticut 06115

#### Dear Governor O'Neill:

Inclosed is a copy of the Paper Goods Pond Dam (CT-00253) Phase I Inspection Report, which was prepared under the National Program for Inspection of Non-Federal Dams. The report is based upon a visual inspection, a review of past performance, and a preliminary hydrological analysis. A brief assessment is included at the beginning of the report.

The preliminary hydrologic analysis has indicated that the spillway capacity for the Paper Goods Pond Dam would likely be exceeded by floods greater than 9 percent of the Probable Maximum Flood (PMF). Our screening criteria specifies that a dam of this class which does not have sufficient spillway capacity to discharge fifty percent of the PMF, should be adjudged as having a seriously inadequate spillway and the dam assessed as unsafe, non-emergency, until more detailed studies prove otherwise or corrective measures are completed.

The term "unsafe" applied to a dam because of an inadequate spillway does not indicate the same degree of emergency as that term would if applied because of structural deficiency. It does indicate, however, that a severe storm may cause overtopping and possible failure of the dam, with significant damage and potential loss of life downstream.

It is recommended that within twelve months from the date of this report the owner of the dam engage the services of a professional or consulting engineer to determine by more sophisticated methods and procedures the magnitude of the spillway deficiency. Based on this determination, appropriate remedial mitigating measures should be designed and completed within 24 months of this date of notification. In the interim a detailed emergency operation plan and warning system should be promptly developed. During periods of unusually heavy precipitation, round-the-clock surveillance should be provided.

NEDED-E Honorable William A. O'Neill

I have approved the report and support the findings and recommendations described in Section 7, with qualifications as noted above. I request that you keep me informed of the actions taken to implement these recommendations since this follow-up is an important part of the non-Federal Dam Inspection Program.

A copy of this report has been forwarded to the Department of Environmental Protection, the cooperating agency for the State of Connecticut. This report has also been furnished to the owner of the project, Sherwood-Industries, Inc., 10 Main Street, Kensington, Connecticut 06037.

Copies of this report will be made available to the public, upon request to this office, under the Freedom of Information Act, thirty days from the date of this letter.

I wish to take this opportunity to thank you and the Department of Environmental Protection for the cooperation extended in carrying out this program.

- Koles

Sincerely.

REPLY TO ATTENTION OF: NEDED-E

MAY 0 6 1981

Sherwood-Industries, Inc. 10 Main Street Kensington, Connecticut 06037

Gentlemen:

Forwarded herewith for your information and use is a copy of the Phase I Inspection Report on the Paper Goods Pond Dam (CT-00253). This inspection was made under the authority of Public Law 92-367 by the firm of James P. Purcell Associates, Inc., under the direction and supervision of the Corps of Engineers. Copies of the finished report have been forwarded to the Governor and the Department of Environmental Protection, the cooperating agency for the State of Connecticut.

The preliminary hydrological analysis contained in Appendix D of this report indicates that the spillway capacity for this dam is insufficient to discharge fifty percent of the Probable Maximum Flood. A storm that would cause a flood of this magnitude could result in overtopping and possible failure of the dam. As a result the dam is adjudged as having a seriously inadequate spillway and is assessed as unsafe non-emergency.

The Governor and the Department of Environmental Protection have each been notified of the dam's spillway inadequacy. We have also advised them of the report's recommendations for steps to be taken to eliminate this problem.

Section 7 of the report contains an evaluation and recommendations, including the one mentioned. If you have any questions concerning this report, we suggest that you contact the Department of Environmental Protection first. Then, if there are further questions, contact the Project Management Branch, Engineering Division, of this office.

We thank you for your cooperation and assistance in carrying out this program.

Sincerely,

Incl
As stated

JOE B. FRYAR

Chief, Engineering Division

#### DEPARTMENT

TERR ARMY

NEW ENGLAND DIVISION CORES OF ENGINEERS

WALTHAM, MASSACHUSETTS 02254

REPLY TO ATTENTION OF: NEDED-E

MAY 06 1981

Mr. Stanley J. Pac, Commissioner Department of Environmental Protection State of Connecticut Hartford, Connecticut 06115

#### Dear Commissioner Pac:

Forwarded herewith for your information and use is a copy of the Phase I Inspection Report on Paper Goods Pond Dam (CT-00253). This inspection was performed in accordance with Public Law 92-367 under the direction of the Corps of Engineers.

The preliminary hydrological analysis contained in Appendix D of this report indicates that the spillway capacity for this dam is insufficient to discharge fifty percent of the Probable Maximum Flood. A storm that would cause a flood of this magnitude could possibly cause overtopping and possible failure of the dam. As a result the dam is adjudged as having a seriously inadequate spillway and is assessed as unsafe non-emergency.

The Governor and the owner have each been forwarded a copy of the report and their attention has been called to the problem concerning the adequacy of the spillway.

We thank you for your cooperation and assistance in carrying out this program and hope this report will help you to develop an effective dam safety program.

Sincerely,

Incl
As stated

JOE B. FRYAR

Chief, Engineering Division

This Phase I Inspection Report on Paper Goods Pond Dam (CT-00253) has been reviewed by the undersigned Review Board members. In our opinion, the reported findings, conclusions, and recommendations are consistent with the Recommended Guidelines for Safety Inspection of Dams, and with good engineering judgement and practice, and is hereby submitted for approval.
